Go2 adopts DDS as the messaging middleware, and the main data interaction adopts two modes: **subscribe/publish** and **request/response**.

- **Subscription/Publishing:** The receiver subscribes to a certain message, and the sender sends messages to the receiver based on the subscription list, mainly used for medium to high frequency or continuous data interaction.
- **Request/Response:** Q&A mode, which enables data acquisition or operation through requests. Used for data exchange during low frequency or function switching.

The call method of the request response interface: **API call**, **functional call**

- **API call:** Similar to the rest API, when a request is sent, the request content and topic are filled in, and a reply is received on the corresponding response topic. The reply adopts broadcast mode, and the corresponding relationship between the request and response is determined based on the UUID.
- **Functional call:** The syntax sugar of API call mode encapsulates API calls into function calls, making it convenient for users to use.

Development kit:

unitree_sdk2: **C++development library**
